# Executive Summary

Agriculture and Horticulture Development Board (AHDB) and Public Health England (PHE) commissioned Quadram Institute Bioscience (QIB) Extra to carry out nutrient analysis of a range of pork cuts. The aim of this survey was to provide up-to-date nutrient composition data for commonly consumed cuts and leaner cuts of pork that are becoming more popular. Changes in breeding and feeding practices along with modern butchery methods mean that a wide range of lean cuts are now routinely available to the consumer. The last comprehensive nutrient analysis survey of pork in the UK was completed in 1992/3. Since the early 90s, in response to the public health need to reduce fat intake, the livestock industry has made comprehensive changes to production and processing methods. It is thought these changes have resulted in significant reductions in the fat content of red meat.

The nutrient composition data generated by this survey will be used to update and extend the data currently held by PHE and will be incorporated into the nutrient databank that supports the UK National Diet and Nutrition Survey and also disseminated via the authoritative UK food composition tables, *McCance and Widdowson's The Composition of Foods*. The data will be incorporated into the next update of the online Composition of Foods Dataset ([CoFID](#)) (early 2020) which will be disseminated via the new Composition of Foods searchable website ([www.quadram.ac.uk/UKfoodcomposition/](http://www.quadram.ac.uk/UKfoodcomposition/)).

This project analysed 10 composite samples that were each made up of between 10 and 11 sub-samples. Samples were purchased from retail outlets and prepared for analysis between January and February 2019.

This sampling report gives details of the sub-samples making up each composite sample. Analytical results from the survey are contained in a separate report. Results for individual fatty acids are reported separately in electronic format.

A further complementary report, containing calculated values for whole cuts (lean and fat) and trimmed cuts (lean and some fat) is also available.

# Sampling notes

1. Samples were collected according to a sample protocol produced in agreement with the AHDB and PHE.
2. Sub-samples were agreed with AHDB and PHE based on a review of market share and nutrient content.
3. All sub-samples were collected between the 27 January 2019 and 4 February 2019.
4. Sub-samples were stored at an appropriate temperature before being combined in equal weights to form a composite sample for analysis.
5. All composites were prepared and processed between the 29 January 2019 and 6 February 2019.
6. Fat was separated from lean portions, based on consumer practice, and weighed for future recalculation. Percentages of trimmable lean and fat can be found in the sample preparation section.
7. Cooking samples were prepared according to package instructions or based on general guidelines from AHDB. Pork leg joints were roasted to medium done.
8. Composite samples were stored at -40°C before being sent to laboratories for analysis.
9. Ingredients, label claims and nutrient information presented in this report have been taken directly from product packaging.

# Sample Preparation

All purchased samples were stored refrigerated at 4°C and prepared as soon as possible, within the recommended use-by date. Details of all sub-samples were recorded prior to preparation of composite samples and all samples including packaging, ingredient and nutrition information were photographed.

Where further sample preparation or cooking was required, samples were prepared according to manufacturer instructions or based on guidance from AHDB. Samples were cooked with fat and skin on before separation into fat and lean portions. In order to ensure representation of the cut of meat, each sub-sample was homogenised thoroughly before combining into the final composite sample. The homogenised sub-samples were added in equal portions and combined as thoroughly as possible to create the composite sample before being split into sub-samples of approximately 100g each. Composite samples were stored frozen at -40°C before being sent to laboratories for analysis. All sub-samples within a composite sample were prepared in a single day and the composite sample was produced on the same day.

Details for each sample are given below, including weight changes on cooking and lean and fat measurements.

## Sample 1: Pork fillet medallions, uncooked

Individual medallions were weighed, photographed, and trimmed of fat by removing any subcutaneous fat, and, where present, any intermuscular fat.

- Average medallion weight = 45.9g
- Average lean = 97.8%
- Average fat = 2.2%

## Sample 4: Pork loin steaks, grilled

Individual steaks were weighed, photographed and grilled according to manufacturers' instructions, where given, or until cooked. Sub-samples without cooking instructions were grilled according to instructions provided by AHDB of 8 minutes each side. Dripping, from several steaks, was recovered after grilling and allowed to cool so that solidified fat and jelly could be collected separately and weighed. Dripping weights are expressed as an average per steak.

- Average grilled steak weight = 88.0g

- Total average weight loss on cooking = 36.5%
- Average lean = 84.9%
- Average fat = 13.8%

## Sample 5: Pork leg roasting joint, uncooked

Individual joints were weighed, photographed and the string and skin/rind removed. The subcutaneous fat and all intermuscular fat were then removed, weighed and photographed.

Two individual joints were used for each sub-sample, except 5.7, where only one was available.

- Average joint weight = 1,532.0g
- Average lean = 73.2%
- Average fat= 17.6%
- Average skin = 8.9%

## Sample 6: Pork leg roasting joint, roasted

Individual joints were weighed, photographed and roasted to medium done according to instructions provided by AHDB (30mins/450g + 30mins, @ 190°C/170°C fan, internal temperature 75-80°C). Two individual joints were used for each sub-sample, except 5.7, where only one was available. The string, crackling and subcutaneous/intermuscular fat was removed after cooking, weighed and photographed. Dripping was recovered after roasting and allowed to cool so that solidified fat and jelly could be recorded. Results of dripping for both joints are expressed as an average in the table below.

- Average roasted joint weight = 983.6g
- Total average weight loss on cooking = 35.7%
- Average lean = 74.2%
- Average fat = 17.1%
- Average crackling = 8.4%
